## **IP Summary**

#### Introduction

An AXI Stream Adapter IP is a component used in digital systems that converts data width of AXI Stream interfaces. The AXI (Advanced eXtensible Interface) protocol is a widely used standard in the design of high-performance digital systems, particularly in the field of digital signal processing (DSP). AXI Stream is a subset of the AXI protocol, which is optimized for high-speed, unidirectional data transfer. The AXI Stream Adapter IP is typically implemented as a programmable hardware block within a Field Programmable Gate Array (FPGA). This allows designers to easily integrate the AXI Stream Adapter IP into their digital systems, while also customizing its functionality to meet specific requirements. Overall, the AXI Stream Adapter IP is an essential component for high-speed data transfer between different components within a digital system, particularly in the field of DSP.

#### **Features**

- · AXI Stream one slave and one master interface
- Configurable data width up to 4096 bits
- · Supports two modes.i.e. Master Mode or Slave Mode

## **Overview**

### **AXI Stream Adapter**

The AXI Stream Adapter IP core is a part of Raptor Design Suite that enables communication between components with different data interface standards, by translating data from one format to another. The IP core is designed to comply with the AXI Stream specification and can be used in various digital systems. The core can operate in two modes: master mode and slave mode. In master mode, the AXI Stream Adapter IP core acts as the initiator of the data transfer, and in slave mode, it acts as the receiver. The core is configurable to support various data widths.

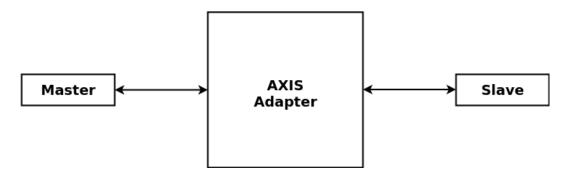

Figure 1: AXI Stream Adapter Block Diagram

## **IP Specification**

#### **Overview**

The AXI Stream Adapter IP core typically includes an AXI Stream interface that supports the AXI Stream protocol. It is configurable to support different data widths, ranging from 1 bit to 4096 bits. It can operate in slave mode, where it receives data from the input data stream, or master mode, where it initiates data transfer to the output data stream. It can be customized to support specific system requirements, including setting the data width.

## **IP Support Details**

The Table 1 gives the support details for AXI Stream Adapter.

| Con    | npliance   | IP Resources |                 |           | Tool I           | Flow                    |            |           |
|--------|------------|--------------|-----------------|-----------|------------------|-------------------------|------------|-----------|
| Device | Interface  | Source Files | Constraint File | Testbench | Simulation Model | Analyze and Elaboration | Simulation | Synthesis |
| GEMINI | AXI Stream | Verilog      | -               | CocoTB    | -                | Raptor                  | Raptor     | Raptor    |

Table 1: Support Details

### **Resource Utilization**

The parameters for computing the maximum and the minimum resource utilization are given in Table 2.

| Tool                | Raptor Design Suite |                      |           |          |  |
|---------------------|---------------------|----------------------|-----------|----------|--|
| FPGA Device         | GEMINI              |                      |           |          |  |
|                     | Configuration       | Resource Utilization |           |          |  |
| Minimum             | Options             | Configuration        | Resources | Utilized |  |
| Resource            | - <b>-</b>          | <b>J</b>             |           |          |  |
|                     | S_DATA_WIDTH        | 8                    | REGISTERS | 55       |  |
|                     | M_DATA_WIDTH        | 8                    | LUTS      | 33       |  |
|                     | ID_WIDTH            | 8                    | -         | -        |  |
|                     | DEST_WIDTH          | 8                    | -         | -        |  |
| Maximum<br>Resource | Options             | Configuration        | Resources | Utilized |  |
|                     | S_DATA_WIDTH        | 4096                 | REGISTERS | 9351     |  |

|                     | ID_WIDTH            | 32                   | -         | -        |  |
|                     | DEST_WIDTH          | 32                   | -         | -        |  |

Table 2: Resource Utilization

## **Ports**

Table 3 lists the top interface ports of the AXI Stream Adapter.

| Signal Name   | Input/Output      | Description                      |  |  |  |
|---------------|-------------------|----------------------------------|--|--|--|
| clk           | Input             | Clock Signal for synchronization |  |  |  |
| rst           | Input             | Active Low Reset Signal          |  |  |  |
|               | AXI Stream Input  |                                  |  |  |  |
| s_axi_tdata   | Input             | Data Port                        |  |  |  |
| s_axis_tkeep  | Input             | Valid Bytes in Data              |  |  |  |
| s_axis_tvalid | Input             | Valid Signal                     |  |  |  |
| s_axis_tready | Output            | Ready Signal                     |  |  |  |
| s_axis_tlast  | Input             | Last transacton Signal           |  |  |  |
| s_axis_tid    | Input             | ID Signal                        |  |  |  |
| s_axis_tdest  | Input             | DEST Signal                      |  |  |  |
| s_axis_tuser  | Input             | USER Signal                      |  |  |  |
|               | AXI Stream Output |                                  |  |  |  |
| m_axi_tdata   | Output            | Data Port                        |  |  |  |
| m_axis_tkeep  | Output            | Valid Bytes in Data              |  |  |  |
| m_axis_tvalid | Output            | Valid Signal                     |  |  |  |
| m_axis_tready | Input             | Ready Signal                     |  |  |  |
| m_axis_tlast  | Output            | Last transacton Signal           |  |  |  |
| m_axis_tid    | Output            | ID Signal                        |  |  |  |
| m_axis_tdest  | Output            | DEST Signal                      |  |  |  |
| m_axis_tuser  | Output            | USER Signal                      |  |  |  |

Table 3: Port List

### **Parameters**

Table 4 lists the parameters of the AXI Stream Adapter.

| Parameter    | Values     | Default<br>Value | Description                    |
|--------------|------------|------------------|--------------------------------|
| S_DATA_WIDTH | 1 - 4096   | 8                | Data Width of Slave Interface  |
| M_DATA_WIDTH | 1 - 4096   | 8                | Data Width of Master Interface |
| ID_WIDTH     | 1 - 32     | 8                | ID field of AXI Stream         |
| DEST_WIDTH   | 1-32       | 8                | DEST field of AXI Stream       |
| USER_WIDTH   | 1 - 4096   | 1                | USER field of AXI Stream       |
| ID_EN        | True/False | True             | ID enable of AXI Stream        |
| DEST_EN      | True/False | True             | DEST enable of AXI Stream      |
| USER_EN      | True/False | True             | USER enable of AXI Stream      |

Table 4: Parameters

## **Design Flow**

#### **IP Customization and Generation**

AXI Stream Adapter IP core is a part of the Raptor Design Suite Software. A customized IP can be generated from the Raptor's IP configuration window as shown in figure 3.

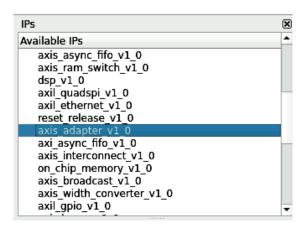

Figure 3: IP List

#### **Parameters Customization**

From the IP configuration window, the parameters of the AXI Stream Adapter can be configured and it's features can be enabled for generating a customized IP core that suits the user application requirements. All parameters are shown in figure 4.

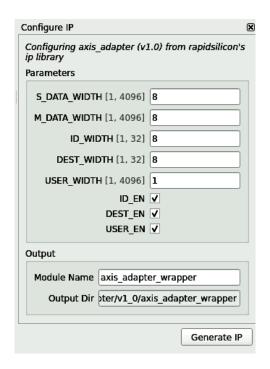

Figure 4: IP Configuration

## **Test Bench**

### **Test for AXI Stream Adapter**

The testbench attached with AXI Stream Adapter is CocoTB based verification environment. The input data is generated using a test data generator module. The input data is written to the input data buffer of the IP core and the output data is read from the output data buffer of the IP core. The output data is compared with the expected output data to verify the correctness of the IP core's operation. The dump file is generated to view the output of the test. In the end, there is status for passing or failure of the test.
